ENERGIST*
Ultra VPL™

The *ENERGIST Ultra* is the most advanced hair removal & skin rejuvenation product available. Utilising state of the art Variable Pulsed Light technology, the *Ultra system* provides the optimal treatment for each individual, ensuring safe, fast and effective treatment.

What makes this system special ?

Traditionally, light based treatment has been associated with Lasers. As technology has progressed, research has shown that Intense Pulsed Light, and in particular Variable Pulsed Light are regularly producing better results than the Laser units originally available. Pulsed light units are non-laser, emitting light across a broad range of wavelengths that are selectively absorbed by the appropriate structure in the skin (eg. hair root, blood vessel etc.).

How does it work ?

The *Ultra system* is designed so that each shot of light comprises a sequence of rapid shorter pulses. These variable pulses ensure more controlled absorption by the appropriate structures whilst minimising heating of the surrounding tissues. This means that a greater range of skin & hair types can be safely and effectively treated than was previously possible.

What can be treated ?

Hair Removal: Unwanted hair can be removed from all parts of the body including legs, chin, upper lip, bikini line, underarms, back & chest, including nipples. The light is absorbed by the melanin [the pigment in the hair] causing the cells which stimulate hair growth to be heated & destroyed. Most areas will require between 6 and 10 treatments but the darker the skin or the lighter the hair, the more treatments will be required.

Skin Rejuvenation: IPL will rejuvenate your skin by stimulating deep collagen production. The new collagen rises to the surface and is spread evenly throughout the skin. Your skin will appear smoother and plumper with skin tone and texture greatly improved and open pores minimised. The treatment of red veins, age spots, rosacea and scar tissue are all included in a rejuvenation session.

During this treatment the light is absorbed by the appropriate structure in the skin stimulating collagen production or coagulating the tiny blood vessels, or breaking up the melanin in the pigmentation patch. Most people will need around 6 treatments for rejuvenation and up to 6 treatments for other conditions.

For red veins: the light is absorbed by the haemoglobin in the blood causing the tiny blood vessels to break up and then be filtered away by the lymphatic system.

For Pigmentation: the light is absorbed by the melanin (the substance in the skin which causes pigmentation) sun spot, age spot or other pigmentation and breaks it up into smaller particles that can be removed by the body's lymphatic system or sloughed away from the skin's surface.

For Scar Tissue and Open Pores: the light stimulates the production of collagen. Collagen is a connective tissue which is naturally present in the skin and gives the skin its elasticity and plumpness. Increased collagen results in smoother scar tissue and tighter pores.

Active Acne: the light stimulates the production of oxygen which destroys the bacteria responsible for the pustules associated with acne. The pustules heal and redness and inflammation are greatly reduced.

Treatment Process

After a Full Consultation with one of our fully trained Therapists, a comprehensive treatment programme can be developed to match your needs.

The area to be treated will be prepared and the applicator head will be stepped across the skin to ensure complete coverage. An intense flash of light is applied to each section of the area to be treated. It feels like a slight sting and for most people is quite tolerable.

Before Treatment

The sun or tanning beds must be avoided for at least 4 weeks before treatment to ensure your skin is as close to its natural colour as possible. They must also be avoided for 7 days after treatment.

Your therapist will advise you at the time of any other precautions to take.

For Hair Removal: the area to be treated should be shaved one to three days before treatment.
